

Thinking of sticking around this summer?
Need to take ENVS 202 for an environmental studies major or a general education science credit? Interested in the science surrounding current environmental issues in Oregon?

****Take ENVS 202 From June 24-July 21st This summer!**

This course is a survey of the contribution of natural sciences to the study of the relationship between human beings and the natural environment. Natural sciences provide powerful tools for describing and understanding environmental issues, as well as a means for evaluating policy decisions that impact the human and more-than-human environment. Theoretical perspectives covered in the course include ecology, climatology, environmental health and toxicology, environmental history, and citizen science. In a society that values specialized, scientific expertise, how does a non-scientist citizen comprehend and meaningfully engage in environmental discussions? This course is part of the three term core sequence in Environmental Studies and is required for Environmental Studies (but not Environmental Science) majors. It is an introductory course, designed for first-years and sophomores, and satisfies university general education breadth requirements for natural sciences. ENVS 201, 202, 203 may be taken in any order.

Please email any questions to the instructor, Shane Hall (shaneh@uoregon.edu)
